Calculus III: Homework 9

34.

- (a) C (Chicago) lies between level curves with pressures 1012 and 1016 mb, and since C appears to be located about one-fourth the distance from the 1012 mb isobar to the 1016 mb isobar, we estimate the pressure at Chicago to be about 1013 mb. N lies very close to a level curve with pressure 1012 mb so we estimate the pressure at Nashville to be approximately 1012 mb. S appears to be just about halfway between level curves with pressures 1008 and 1012 mb, so we estimate the pressure at San Francisco to be about 1010 mb. V lies close to a level curve with pressure 1016 mb but we can't see a level curve to its left so it is more difficult to make an accurate estimate. There are lower pressures to the right of V and V is a short distance to the left of the level curve with pressure 1016 mb, so we might estimate that the pressure at Vancouver is about 1017 mb.
- (b) Winds are stronger where the isobars are closer together (see Figure 13), and the level curves are closer near S than at the other locations, so the winds were strongest at San Francisco.
- **43.** The level curves are $(y-2x)^2=k$ or $y=2x\pm\sqrt{k}$, $k\geq 0$, a family of pairs of parallel lines.

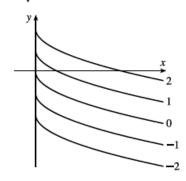

44. The level curves are $x^3 - y = k$ or $y = x^3 - k$, a family of cubic curves.

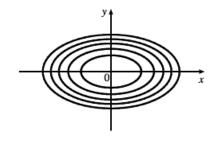

Calculus III: Homework 9

45. The level curves are $\sqrt{x} + y = k$ or $y = -\sqrt{x} + k$, a family of vertical translations of the graph of the root function $y = -\sqrt{x}$.

53. The isothermals are given by $k=100/(1+x^2+2y^2)$ or $x^2+2y^2=(100-k)/k \ [0< k \le 100],$ a family of ellipses.

59.
$$z = \sin(xy)$$
 (a) C (b) II

Reasons: This function is periodic in both x and y, and the function is the same when x is interchanged with y, so its graph is symmetric about the plane y = x. In addition, the function is 0 along the x- and y-axes. These conditions are satisfied only by C and II.

60.
$$z = e^x \cos y$$
 (a) A (b) IV

Reasons: This function is periodic in y but not x, a condition satisfied only by A and IV. Also, note that traces in x = k are cosine curves with amplitude that increases as x increases.

61.
$$z = \sin(x - y)$$
 (a) F (b) I

Reasons: This function is periodic in both x and y but is constant along the lines y = x + k, a condition satisfied only by F and I.

62.
$$z = \sin x - \sin y$$
 (a) E (b) III

Reasons: This function is periodic in both x and y, but unlike the function in Exercise 61, it is not constant along lines such as $y = x + \pi$, so the contour map is III. Also notice that traces in y = k are vertically shifted copies of the sine wave $z = \sin x$, so the graph must be E.

Calculus III: Homework 9

63.
$$z = (1 - x^2)(1 - y^2)$$
 (a) B (b) VI

Reasons: This function is 0 along the lines $x=\pm 1$ and $y=\pm 1$. The only contour map in which this could occur is VI. Also note that the trace in the xz-plane is the parabola $z=1-x^2$ and the trace in the yz-plane is the parabola $z=1-y^2$, so the graph is B.

64.
$$z = \frac{x - y}{1 + x^2 + y^2}$$
 (a) D (b) V

Reasons: This function is not periodic, ruling out the graphs in A, C, E, and F. Also, the values of z approach 0 as we use points farther from the origin. The only graph that shows this behavior is D, which corresponds to V.

- **65.** k = x + 3y + 5z is a family of parallel planes with normal vector (1, 3, 5).
- 67. Equations for the level surfaces are $k = y^2 + z^2$. For k > 0, we have a family of circular cylinders with axis the x-axis and radius \sqrt{k} . When k = 0 the level surface is the x-axis. (There are no level surfaces for k < 0.)
