

[illegible][illegible][illegible]

Automata LEGO

Given are two automata for languages L and M . Construct
(non-deterministic) automata for $L \mid M$ and LM and L^* .

Converting M to M' with only one accept.

Automata LEGO

What if we wanted DFAs for $L|M$ and LM and L^* ?

Just convert to DFA

(Direct lego with DFA's
is inconvenient).

Regex to automata

Construct a non-deterministic automaton for $(01)^*|(10)^*$.

Illustrates a
general process
regex
 \downarrow
NFA.

$(10)^*$

More NFA LEGO

Given an automaton with language L , can you construct an automaton with language L^{rev}

$$L^{\text{rev}} = \{\text{Reverses of all the words in } L\}.$$

Assume have one accept state.

New start = old accept

New accept = old start

New arrows = reverses of old arrows

reverse machine
may be Nondet.

Q: Is grammar checkable
by regex?
